

°red sun fx grantler

Description

The Grantler is a simple but versatile pedal based on a 1W power amp to simulate that special distortion only a saturated amp can deliver.

The circuit was designed in the tradition of modern classics but with the trademark °red sun fx tweaks and twists to make it a great pedal with its own character and many tonal possibilities.

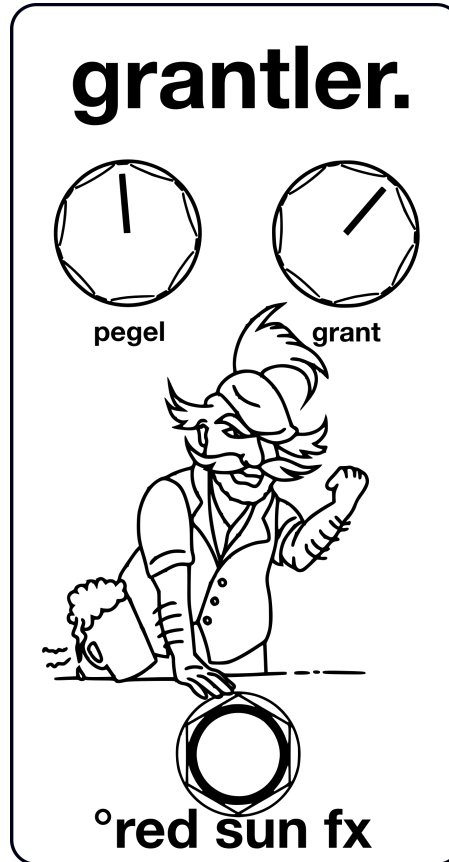

Btw, Grantler is a Bavarian term for a grumpy man usually sitting in beergardens in southern Germany swearing and shouting. Just like this pedal: loud & rude!

Warranty

°red sun fx carry a limited lifetime warranty for the original owner. This does not cover defects caused by wear of parts or misuse.

This illustration shows recommended settlings to start with

Connectors

Instrument

– input jack on the right

Amplifier

– output jack on the left

Power Supply – top side – please use 9V DC center-negative DC power adapter only. Current draw approx. 5.8 mA

Directions

Pegel – controls the overall Master output of the power amp. Attention: This circuit is LOUD - please start testing with Pegel set to 12 o'clock.

Grant – controls the preamp gain that will be passed on to the power amp and will also alter the sonic spectrum of the distortion.

internal – flipping the DIP switch inside the pedal to ‚one beer‘ position will lower the available gain by a factor of 10 – from brutal distortion to sweet crunchiness in no time.
